

Find Your Top Talent

Product Brief · Self-knowledge + AI matching for high-agency communities

Find Your Top Talent helps communities move from talent density to real opportunities. Members clarify the role they are naturally here to play, what they are moving toward, and what resources, skills, and access they already hold. AI then surfaces possible collaboration matches so the community can see who should build, trade, refer, support, hire, or explore something real together.

Core thesis

Most communities are still directories of high-agency people, not coordination systems. They gather impressive members, but the deeper value often remains invisible: who should collaborate with whom, why the match matters, and what concrete opportunity could emerge.

Can members point to something real that happened because they were in this community?

The problem	The product	The metric
Low collaboration throughput: members may enjoy the community but leave without projects, referrals, clients, collaborators, hires, trades, or venture seeds.	Self-awareness software plus AI matching: help people articulate who they are, what they care about, and what they have to give.	Collaboration rate: the share of members who find a collaborator and begin building, trading, referring, hiring, supporting, or exploring something concrete.

The first deployable module

Precision Purpose Discovery	Identifies what role each member is naturally here to play.
Precision Mission Discovery	Clarifies what each member is moving toward.
Precision Resource Mapping	Maps what each member already has to build with: skills, assets, knowledge, networks, offers, access, and lived experience.

Once this data is visible and structured, AI can surface possible collaboration opportunities across the group. The product does not claim to force collaboration. It makes hidden collaboration opportunities visible, testable, and easier to act on.

Activation format

The most direct front-door format is a Collaboration Discovery Session.

- 5-10 volunteer members complete onboarding.
- AI prepares pairings or small-group collaboration hypotheses.
- Sasha hosts a live session with the community.
- Members review the suggested matches together.
- Each match is rated: does this make sense, would you explore it, what would make it more useful?
- The leader receives a first map of hidden collaboration, venture, and project opportunities.

This collapses product demo, member value, market research, and proof into one event. The leader does not have to believe the theory. They can watch whether hidden opportunities become visible inside their own community.

Architecture

Member layer	Top Talent discovery, mission discovery, resource mapping, Quality of Life signal, collaboration readiness.
Community layer	Member onboarding, AI matching, Collaboration Discovery Sessions, community-specific skins, optional cross-community matching.
Network layer	White-label deployments, opt-in data sharing, branded self-knowledge programs, revenue share, steward governance.

Design principle: each community keeps its identity, while the shared engine improves as more communities use it.

Business model

Pilot session

Run one Collaboration Discovery Session for a small member group.

White-label deployment

Run onboarding and matching under the community's brand.

Branded self-knowledge products

Communities offer high-transformative-value tools under their own brand, keeping 90 percent while 10 percent flows back to the shared engine.

Stewardship and co-development

Aligned communities help evolve the platform, decentralize governance, and protect shared data infrastructure.

Current status

Find Your Top Talent is a working web platform and living product system, not a concept deck.

- Public landing experience and Top Talent discovery flow
- Member shell with modular spaces for self-knowledge, learning, collaboration, and building
- Unique Business Builder for turning natural leverage into business artifacts
- Public Planetary OS one-pager
- White-label skins including Network School, Daouniverse, Karime, and Planetir-oriented deployments
- Documentation corpus covering product strategy, architecture, prompt systems, playbooks, governance, licensing, monetization, and roadmap

Subject matter expertise demonstrated

Product strategy	AI self-knowledge and matching systems	Community coordination
Venture-building methodology	White-label SaaS architecture	Prompt and knowledge-system design
Governance and decentralization	Commercial model design	Systems-to-product translation

People need help articulating who they are, what they care about, and what they have to give. Once that becomes clear data, AI can help groups see who should talk to whom.
