The evolutionary stages are not linear — they are spiralic.
We loop through them at new octaves for each creation.

STAGE	1	2	3	4	5	6
Name	Analog Coordination	Digital Files	Work in the Cloud	Linked Work	CollabTech	Programmed Networks
Essence of What Happens	We coordinate by talking and paper; sharing is manual and slow.	Work is in docs and email; online but disconnected.	We co-edit in cloud docs/boards/ch at, but work is scattered across tools.	Tasks, files, people, and decisions connect on one work map; dependencies and status are clear.	Small, flexible teams (people + AI) add externals fast, agree with one click, do the work on the same map, and get auto-settled with fair splits.	Work routes by clear rules, money streams as progress happens, teams spin up on demand.
Qualifier	Most work units live offline or in people's heads.	Most work units are docs/emails with no consistent link to owners or tasks.	Most work units are co- edited online; tasks/files/con- versations are not consistently linked.	Most tasks show owner + linked files + last decision in one place; cycle time clearly improves.	An external collaborator can be added in <15 min, click- agree inside the integrated tool, and payments auto-split on delivery (24- 48h)	Policies (not meetings) trigger most hand-offs and payouts; progress-based streaming payouts are live; disputes close fast by a standard process.
